

# Health Tech

Leveraging multi-disciplinary skills in science and technology to improve health outcomes by transforming the health ecosystem.

Ashraf Ul Kabir  
Chief Technical Architect  
IBM Pakistan

Can data heal healthcare?

IBM

# Quadruple aim

# Disruptive forces

Market forces are escalating the cost, quality, and experience crisis across health systems everywhere

## Physician Shortage and Burnout Rising

**12.9M**

Expected global shortage of health-care workers by 2035

## Data Explosion

Medical data expected to **double every 73 days** by 2020

How much health related data each person will generate in a lifetime:

**300M Books**

## Caring for the aging and vulnerable, a demographic tsunami

**>3x**

Growth of global "oldest old" population<sup>1</sup>

**2 Billion**

The number of people over the age of 60 by 2050<sup>7</sup>

## Rising demands from empowered citizens to improve safety

**1 in 300**

Chance of a patient being harmed during health care.<sup>3</sup>

# Industry challenges

Digitization is transforming the entire sector and driving the research agenda.

365  
days

*For the rest of your life.*

The biggest challenge

*Job to be done: Keep glucose level in range*

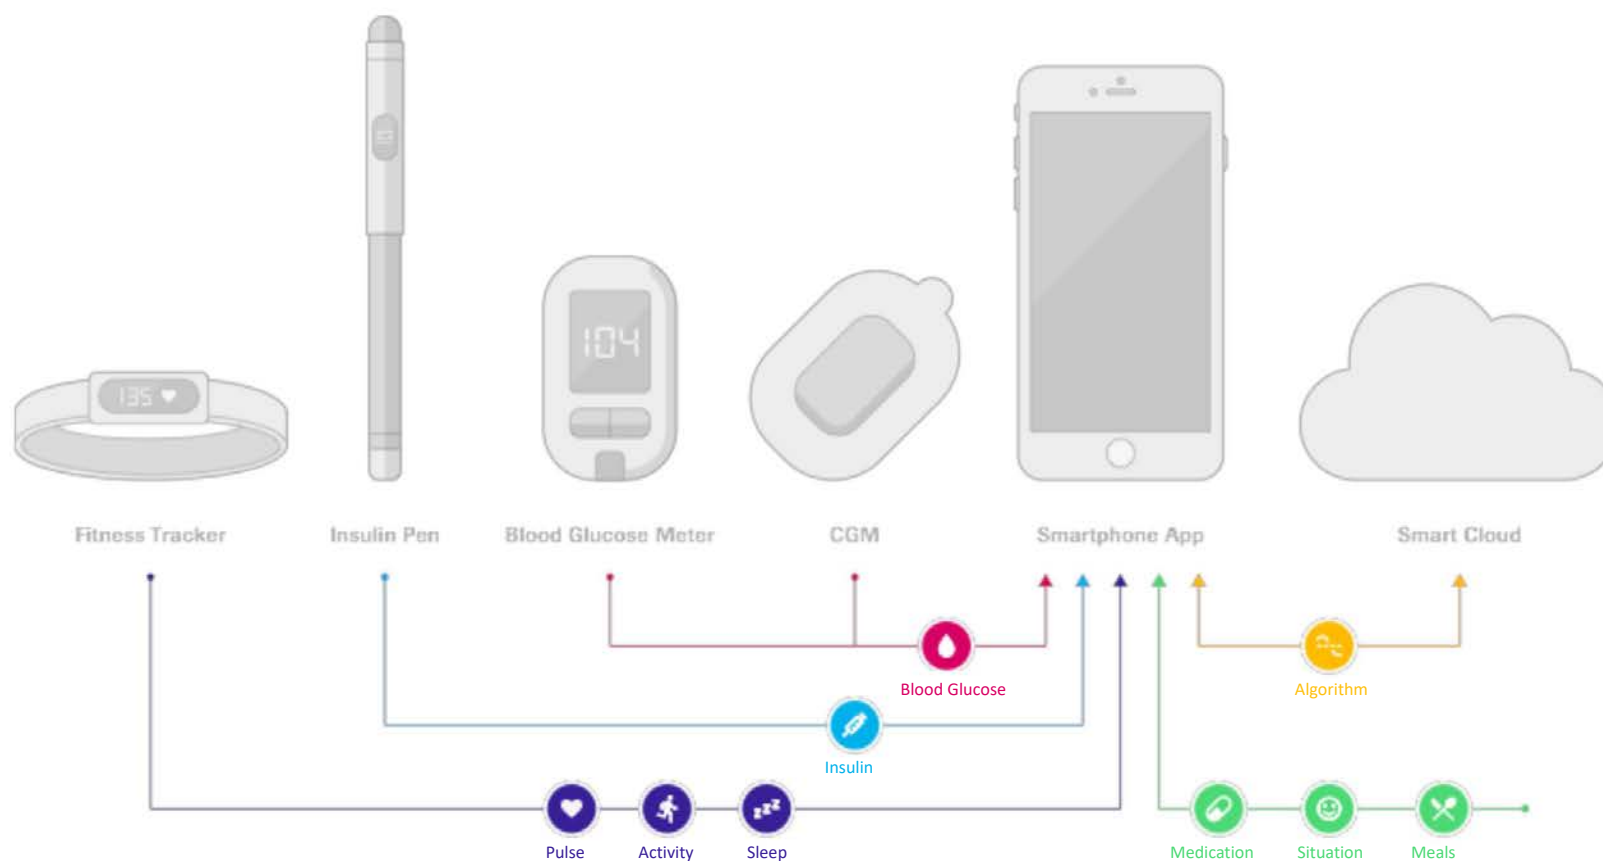

Hyper

Hypo

## Components

Smartlife

*Understand*

*Detect patterns*

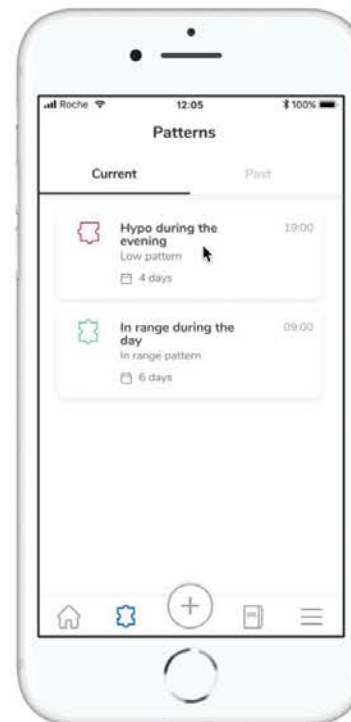

*Draw conclusions*

*Find options*

*Take action*

## *Understanding the past | Pattern Detection to learn more about the individual therapy, change behavior accordingly and track progress*

Patterns will help PwDs to enhance their therapy by stressing the areas of improvement and motivate them to change their routines by showing the areas of success.

## *Looking even further | Prediction of nocturnal hypoglycaemia – Sleepgenius for the entire night*

The goal is to provide PwDs the peace of mind for good nights sleep: During an eight hour window (night) the model shows the chance of nocturnal hypoglycemias.

# Tackling Counterfeit Drugs

Trace and Track using Blockchain technology

In some countries,  
counterfeit  
pharmaceuticals  
account for  
**70 percent**  
of all drugs in the  
supply chain.

Source: National Crime Prevention Council  
(<https://www.ncpc.org/resources/ip-theft/counterfeit-drugs/>)

...the **Drug Supply Chain Security Act (DSCSA)**,  
outlines steps to build an  
electronic, interoperable  
system to identify and  
trace certain  
prescription drugs as  
they are distributed in  
the United States.

# The FDA DSCSA Interoperability Pilot

IBM and its partners completed work for the FDA Drug Supply Chain Security Act (DSCSA) Interoperability Pilot, and aim to formally launch and scale the blockchain-enabled solution to streamline and facilitate DSCSA compliance for pharmaceutical supply chain stakeholders. To comply with the DSCSA, organizations must be able to digitally verify a drug product and its journey through the end-to-end supply chain. The pilot application uses blockchain technology to digitally store pharmaceutical product profiles and track and trace products at the serialized unit level from the point of manufacture to the point of dispense.

In addition to supply chain visibility, the pilot leverages blockchain to strengthen the protection of patients and patient safety. The application allows users the ability to quickly and effectively identify, investigate, and communicate about a relevant suspect or illegitimate drug product. This eliminates data siloes between supply chain actors and has strong potential to improve and expedite the drug recall process.

## User's Benefits

Verify a serialized drug product's validity

Manage product verification requests

Flag suspect or illegitimate (counterfeit) drugs

Receive automatic, near real-time alerts about a relevant drug product's status

Retrieve relevant chain of custody information in the event of a manufacturer-generated recall

**Manufacturer**

 The manufacturer produces the drug and marks it with a unique code

 The information is stored on the blockchain

**Distributor**

 The wholesaler verifies the origin of the product

 The transaction is added to the blockchain

**Pharmacist**

 The pharmacist verifies the origin of the product

 The transaction is added to the blockchain

**Patient**

 The patient verifies the origin of the product

 The transaction is added to the blockchain
